My Dear Professor;

The Guatemala *Aetheta* comes
nearest to (*Homalota*) *perdita*
Thp. but is apparently not an
Aetheta (for the mesosternum
is rounded), rather a *Hammaraea*;
now am I certain about the
species.

I shall work up *Aetheta*
some day, and separate from
it a number of species belonging
to other (old and new) genera.

Very sincerely yours

A. Ferries

Dear Professor Thaxter,

You have given me a difficult task this time, but I have done the best I can, and enclose alist. Most of your beetles are new to us. As in most cases I am unable to give you specific names, I am returning the specimens in a small box with the exception of a few examples of Anthicus, etc., which are named, and which I have retained for the collection. I hope the list I send will be sufficient for your purpose.

Yours very sincerely,

Gilbert S. Arrowood
